Statement on the usage of AI

AI was used throughout the project. Specifically, generative AI was used in the form of LLM (Claude Opus 5.5) to act as a coding assistant. This tool was chosen purely for efficiency reasons, as this particular LLM (and its evolutions) has proven capable of writing well-written code and performing well-formed reasoning. All code written by Claude was validated by hand and modified where necessary, avoiding "vibe coding" whenever possible. The code was then commented by hand for improved usability. No other AI was used in any other section of the project. All code has been written using the regular VSCode ambient without the use of integrated AI add-ons. Research and study of the papers, as well as data collection for the dataset and the writing of the final report, were performed by hand, with the exception of writing the LaTeX code for one of the tables, which was processed by Opus 5.5 from the files containing the experiment results. The table and its contents were however validated by hand.
